Functional Requirements- SRS

Functional Requirements of Pearson

Introduction:

Pearson is a well-known publishing and education organization that develops and provides books and educational resources for students, teachers, and professionals. A book publishing management system can help organize important publishing activities, from receiving manuscripts from authors to reviewing, editing, publishing, and distributing books. The system can also maintain information about authors, books, inventory, customers, and orders in an organized manner.

The following functional requirements describe the major operations that can be supported by a Pearson-like book publishing system.

1.1 User Registration and Login:

The system should allow authors, editors, staff members, and customers to create accounts and log in using their registered credentials.

Users should be able to manage their account information after logging in.

1.2 Author Profile Management:

The system should allow authors to create and maintain their professional profiles.

Authors should be able to update information such as name, contact details, biography, and areas of specialization.

1.3 Manuscript Submission:

The system should allow registered authors to submit their book manuscripts through the platform.

Authors should be able to provide details such as book title, subject, category, description, and upload the manuscript file.

1.4 Manuscript Status Tracking:

The system should allow authors to check the current status of their submitted manuscripts.

Possible statuses may include Submitted, Under Review, Revision Required, Approved, Rejected, and Published.

1.5 Editorial Review:

The system should allow authorized editors to access manuscripts assigned to them for evaluation.

Editors should be able to review the submitted content and provide comments or recommendations.

1.6 Revision Management:

If changes are required, the system should notify the author and allow the author to submit a revised version of the manuscript.

The system should maintain information about previous and revised submissions.

1.7 Manuscript Approval:

The system should allow authorized editors or publishing staff to approve or reject manuscripts after the required review process.

The decision and relevant comments should be recorded in the system.

1.8 Book Information Management:

The system should allow publishing staff to create and maintain records for approved books.

Book information may include title, author, subject, category, edition, description, publication date, price, and other relevant details.

1.9 Book Category Management:

The system should allow books to be organized into different categories and subjects.

Users should be able to browse books based on categories such as Mathematics, Science, Computer Science, Business, Languages, and other academic areas.

1.10 Book Search:

The system should allow users to search for books using keywords such as book title, author name, subject, ISBN, or category.

Search results should display the books matching the entered information.

1.11 Book Details:

The system should provide detailed information about a selected book.

The details may include book title, author, description, edition, publication date, subject, price, availability, and cover image.

1.12 Book Availability:

The system should display the availability of published books.

Users should be able to determine whether a particular book is currently available, out of stock, or discontinued.

1.13 Inventory Management:

The system should allow authorized staff to maintain the quantity of published books available in inventory.

Staff should be able to add new stock, update quantities, and monitor books with low stock levels.

1.14 Customer Order Management:

The system should allow customers to select available books and place orders.

The system should generate a unique order number and store the details of each order.

1.15 Order Status Tracking:

Customers should be able to view the status of their orders.

The system may display statuses such as Order Placed, Processing, Shipped, Delivered, or Cancelled.

1.16 Notifications:

The system should notify users about important activities.

For example, authors can receive notifications about manuscript reviews or revision requests, while customers can receive notifications about order updates.

1.17 Book Recommendation:

The system should be able to display related books based on the subject, category, or author selected by the user.

This can help users discover other relevant books.

1.18 Reports and Records:

The system should allow authorized staff to generate reports related to publishing activities.

Reports may include submitted manuscripts, approved books, published books, inventory levels, customer orders, and sales information.

1.19 Profile and Activity Management:

Users should be able to manage their personal information and view relevant activities from their profile.

For example, authors can view their submitted manuscripts, while customers can view their previous orders.

Conclusion:

The functional requirements describe the essential activities of a book publishing management system. The system can help manage authors and manuscripts, support the editorial process, maintain book records, monitor inventory, and handle customer orders. By bringing these activities together in one system, the publishing process can become more organized, easier to track, and more efficient for both publishing staff and users.
