Functional Requirements-SRS

Functional Requirements of Pearson

Introduction

Pearson is an online education and learning platform that helps users find and access courses, digital textbooks, and learning resources across different subjects and levels. Users can enter their learning requirements, view available courses, compare options, apply filters, and enroll in a suitable course.

The following are the main functional requirements of a Pearson-like system.

1. Functional Requirements

1.1 User Registration and Login

The system should allow users to create an account and log in using their email and password. Users should also be able to manage their account details.

1.2 Course and Content Search

The system should allow users to search for courses, textbooks, and learning materials by entering subject, grade/level, and keywords.

1.3 Learning Type Selection

Users should be able to select the type of learning they want, such as self-paced course, instructor-led course, or a digital textbook.

1.4 Learner and Level Selection

Users should be able to select the number of learners and their preferred education level, such as School, Higher Education, or Professional/Skills.

1.5 Display Course Results

After completing a search, the system should display available courses along with information such as course title, provider, duration, level, and price.

1.6 Course Comparison

The system should allow users to compare different courses based on price, duration, rating, content format, and other available details.

1.7 Filtering and Sorting

Users should be able to filter course results according to their requirements. For example, they can filter courses by price, subject, level, or rating. They should also be able to sort results by price or popularity.

1.8 Flexible Schedule Search

The system should allow users to search for courses using flexible start dates. This helps users find alternative schedules that may better suit their availability.

1.9 Related Subject Search

The system should allow users to include related subjects or topics in their search. This can give them more course choices and better learning options.

1.10 Explore Subjects

The system should allow users to explore different subjects and categories when they have not decided what they want to learn.

1.11 View Course Details

The system should provide detailed information about a selected course, including title, instructor/provider, duration, syllabus, and fee details where available.

1.12 Enrollment Redirection

When a user selects a course, the system should redirect them to the enrollment or checkout page where they can complete the purchase or registration.

1.13 Price and Offer Alerts

The system should allow users to set alerts for selected courses. Users should receive a notification when there is a discount or price change.

1.14 Save Courses

Users should be able to save courses that they are interested in and view them later.

1.15 Search History

The system should keep a record of the user's recent searches so that previously searched courses can be accessed easily.

1.16 Currency Selection

The system should allow users to select their preferred currency and display course prices accordingly.

1.17 Profile Management

Users should be able to update their personal information and manage their saved courses, search history, and alerts from their profile.

Conclusion

The functional requirements define the main operations that a Pearson-like system should perform. These features allow users to search for courses, compare different options, find suitable prices, save their choices, and proceed to enrollment or purchase of the relevant learning resource.
